

Tropical fish

Tropical fish are most commonly found in freshwater rather than saltwater due to the fact that freshwater is more available. They live in heated aquariums [arias] to make sure that they do not freeze. The reason that most tropical fish are kept in freshwater is because when saltwater is evaporated it comes back down no longer saltwater and it would have to be monitored with more saltwater and most people do not have time for that bhj5ew. Normally tropical fish can be found in large groups close to the equator to keep warm.

Clownfish

Clownfish can grow from 2 to 5 inches in length and can be easily found in a croud of fish due to the white and black stripes on top of the orange. Did you now that there are 28 diferent spicies of clownfish in the Indian , the Pacific oceans , the red sea and the Australien Great Barrier Reaf. Clownfish are also known as Anemonefish because they live in a part of the sea where there are lots of sea Anemones. Conviniently Clownfish are imune to anemones venume because they have a thick layor of muscle around the surfice of there body

Blue Tang Fish

Blue Tangs can communicate using their color, for example when a Blue Tang is grumpy it will start to get darker. It will also get less vibrant the older it gets. Their tail and back is covered in venomous spines. If the Blue Tang fish is being chased by a predator it will unfold its spine and violently thrash around. Their size stretches from around 5 to 11 inches and a male is normally larger.
